

No confirmed evidence of bats roosting.

Suitable entry/egress features included:

Potential entry/egress features include:

- Missing and lifted hanging tiles providing access to a brick wall. The brick wall behind is well pointed and no potential access to cavity wall recorded.
- Missing tiles on pitched roof extension, void examined during internal inspection with no evidence of bats. Open to elements.
- Porch roof has missing tiles with potential for crevice dwelling bats behind. Small feature.
- Missing tiles and lifted tiles on roof. Potential to roost between tiles and roof lining. Internal inspection ruled out presence within the roof void itself due to dense, thick cobwebs throughout.
- Missing vent – brick in entrance could be fully examined internally and externally and no evidence of bat recorded.
- Damaged window and door frames – although scoped out during internal inspection
