

Hi Lesley,

I've had the following from my client about how the panels are to be secured, this doesn't in fact include digging:

"Hi Jojo, It's a ballasted array, so different to a conventional ground mount array the Council may be used to seeing. So for the array there would not be any "ground fixings". Also for the cables around the array, these are typically surface mounted (not buried). Cables are sat on narrow metal 'cable tray' fixed onto bricks or some other ballast to hold in place. Being a tank also means trenching around the array is not a good idea."

I hope this provides the necessary clarification in terms of archaeological impacts but please let me know if you need more information.

Kind regards,

Jojo
