

I refer to the Planning application referenced above for 4 wind turbines at Penners Rd Havant which was received by surface mail.

NATS has assessed the application and has determined that the turbines are expected to be detected by its radar infrastructure. However, the impact is considered to be acceptable. Accordingly NATS has no objection to the application.

I attach some general guidance from NATS regarding the potential impact upon our infrastructure and operations. Whether any potential impact might exist, can be ascertained through the use of our self-assessment maps or pre-planning service. Please note these maps are now available as easy to use Google Earth layers.

Our advice is for developers to familiarise themselves with the aviation aspects of wind farms and to include any evidence of assessments in their documentation. We would also advise developers to engage with NATS should they anticipate any issues, at the earliest opportunity.

Also, we would like to take this opportunity to request you update your records for NATS as follows, and note our preference to receive consultations by email.
