

Dear Sir,

I write with regard to the discharge of the above application. I enclose 9 photographs of the planting area. Each border to the left and right of the two central posts have identical plants in sequence. They are from far left and far right, Zebra grass, Euphorbia, Heuchera, Euonymus, (both green and golden,) bronze grasses, and with cyclamen planted in between. I had hoped to plant some Spring bulbs, but the ground is solid clay and has been saturated for the last seven months, and had I been able to dig the border at all and plant any bulbs they would all have rotted. Further more, the border is right over a main sewage drain thereby making it impossible to plant in that area, which had the fence been erected next to the pathway as before, would have been inside the garden and taken into account accordingly. The plants chosen have grown noticeably since planted as you will see in the difference between the first photograph and the following 8. Over the next two months I plan to add more plants to enhance the area but will need to choose plants that like a great deal of moisture. I will also look at some climbers that are evergreen and in particular the suggested Clematis Almondii. I hope this information complies with what you required. I shall now also pay the fee of £28 as required.

Yours sincerely,

Diana Patrick
