

**DESCRIPTION OF WORKS TO SILVER BIRCH T5 ON
TPO1222.**

**(Attachment to Application for tree works by John Gough of
1 Ttius Gardens, Waterloooville dated 28th June 2013).**

Lift crown of tree T5 by approximately 1.5 meters by the removal at point of origin of the North East facing limb identified in Figure 3 and the further removal of minor South East and North West facing limbs as identified in Figure 2.

In addition to lifting of the crown, a crown reduction of 4.5 meters is proposed to reduce overall height and rebalance the shape particularly where tree is adjacent to trees T6 and T7. During crown reduction; thinning and crown cleaning of approximately 15% is proposed by the removal at point of origin of smaller secondary live wood growth (while retaining the framework branches) in addition to weak, damaged, dead, rubbing, crossing or duplicated branches to reduce leaf area of the canopy.

The aim of the works is to produce an even canopy of foliage on a well structured, balanced, and sound framework of limbs and branches typical for a silver birch.

Final height to be approximately 11 meters with a spread of approximately 8 meters.
