Ash Tree – Park View Lodge Rest Home

Tuesday 22nd October 2013

Visual Tree Assessment (VTA)

No specialist equipment was used above or below ground level

The mature Ash tree has shown major signs of decline. Removal of large diameter deadwood has been carried out under Dead and Dangerous legislation. Also removal of a large scaffold due to Historic wounding and woodpecker hole and major decay was evident. At the base of the trunk there are signs of fungal decay causing rot and loss of bark. No fruiting bodies were visible at time of inspection so type of fungal decay is not known. Due to the close proximity of the Ash tree and care home the level of risk is high and felling of the tree and replanting with a replacement species would be the sustainable action to take.

Yours sincerely,

Andrew Tomasso Dip Arb
