General installation instructions

You are advised to have your intended installation checked and surveyed by an appropriately qualified person. In the UK this would be a HETAS chimney specialist for solid fuel systems or GasSafe registered member for gas systems. They will also be able to complete your installation in accordance with the current local building regulations.

For further guidance on installation issues that are not already detailed within the Professional XQTM Chimney Systems Installation Instructions, you can contact one of the following:

- HETAS (Heating Equipment Testing and Approval Scheme)
- NACS (National Association of Chimney Sweeps)
- Manufacturers installation instructions for the heating appliance.

Further checks by your installer will be required to ensure that an adequate air supply is available for combustion and it is essential these checks are carried out prior to installation.

It is important that you have fully designed your system and read all the relevant instructions and local building regulations and taken expert advice before commencing installation.

In particular you will need to ensure the installer has checked all local regulations, including those referring to national and European standards, to ensure full compliance of your installation.
